

A CLOSURE AND A CONTAINER FOR PACKING PRODUCTS**ABSTRACT OF THE DISCLOSURE**

5 A closure is described, particularly for use on liquid-packing containers, comprising a first substantially circular portion, from the end of which a second substantially cylindrical portion projects, which is substantially orthogonal to the first portion, the closure being characterized in that it comprises a sealing system provided with a first sealing element
10 associated to the first portion and second and third sealing elements associated to the second portion, the first, second and third sealing elements cooperating with the packing container;

- the first and the third sealing elements providing sealing by deformation when the closure is associated to the container;
- 15 - the second sealing element providing sealing by direct compression when the closure is associated to the container.

Also, a container for packing products is described, which comprises the above-described closure.
